

System and Network Engineering MSc
Research project

PIRE ExoGENI – ENVRI preparation for Big Data science

Stavros Konstantaras, Ioannis Grafis

February 5, 2014

Background

Big Data science

- Huge amount of data
 - Many sources
- Data Movement (DM) is very important
 - Described by “5V”s (Volume, Velocity, Variety, Variability and Value)

Software Defined Networking (SDN)

- Separate control plane from data plane
- Single entity controls the network
- Forwarding intelligence relies on programmers

Research questions

The main research question is the following:

- *To what degree can the performance of the data movement protocols be optimized by using Software Defined Networking technology?*

The main research question includes the following sub-questions:

- *What network level problems exist which limit the performance of the data movement protocols?*
- *How can SDN eliminate these problems?*

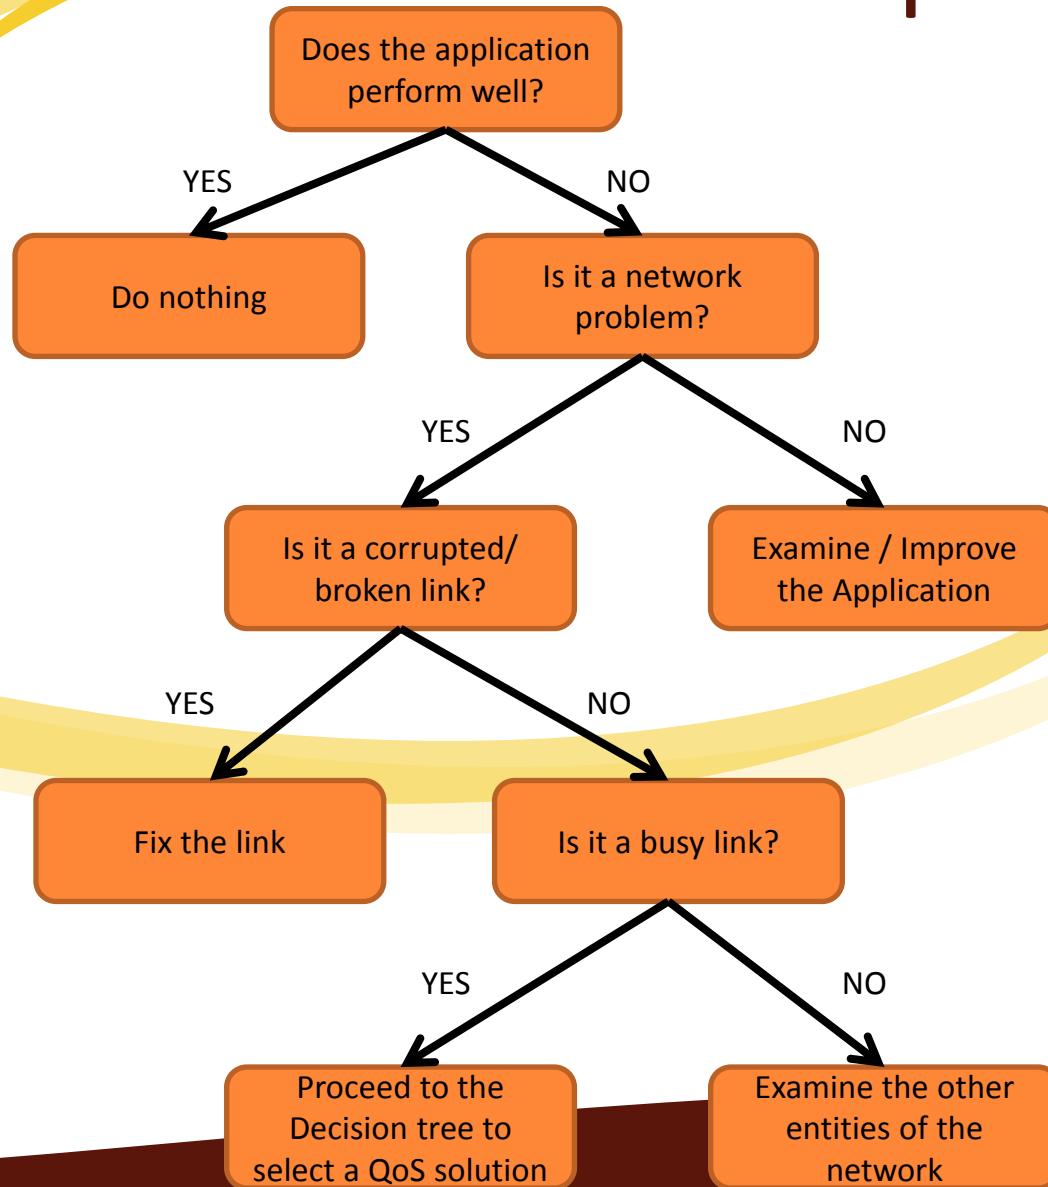

Outline

- Theory part
 - *Problem analysis*
 - *Solution profiles*
- Experimental part
 - *Prototyping HIDE*
(Hybrid Intelligent Data Enhancer)
 - *Scenarios and Results*
- Conclusion

Data Movement Application problems

Application	Positives	Negatives	Network limits
GridFTP (Globus)	<ul style="list-style-type: none"> -Open source -High scalability -High reliability -Option to resume transfers that are stopped because of failures 	<ul style="list-style-type: none"> -Difficult to deploy -Network speed limit: (13 Gbps for TCP version) 	<ul style="list-style-type: none"> -Decrease window size for every loss packet and resend the packet -Application is not aware for the topology and the path that data flows -Most of times the speed of transferring data is limited due to network traffic
bbFTP (NASA)	<ul style="list-style-type: none"> -Open source -High scalability -High reliability -Multi-stream TCP -Easy to deploy -Resume file transfer session 	<ul style="list-style-type: none"> -Transfer only files, not directories -Little industry adoption -Little documentation 	
FDT (CERN)	<ul style="list-style-type: none"> -Open source -Runs on all major platforms (Java application) -Multi-stream TCP -Resume file transfer session 	<ul style="list-style-type: none"> -Little industry adoption -Little documentation -Network speed limit (4.5 Gbps) 	

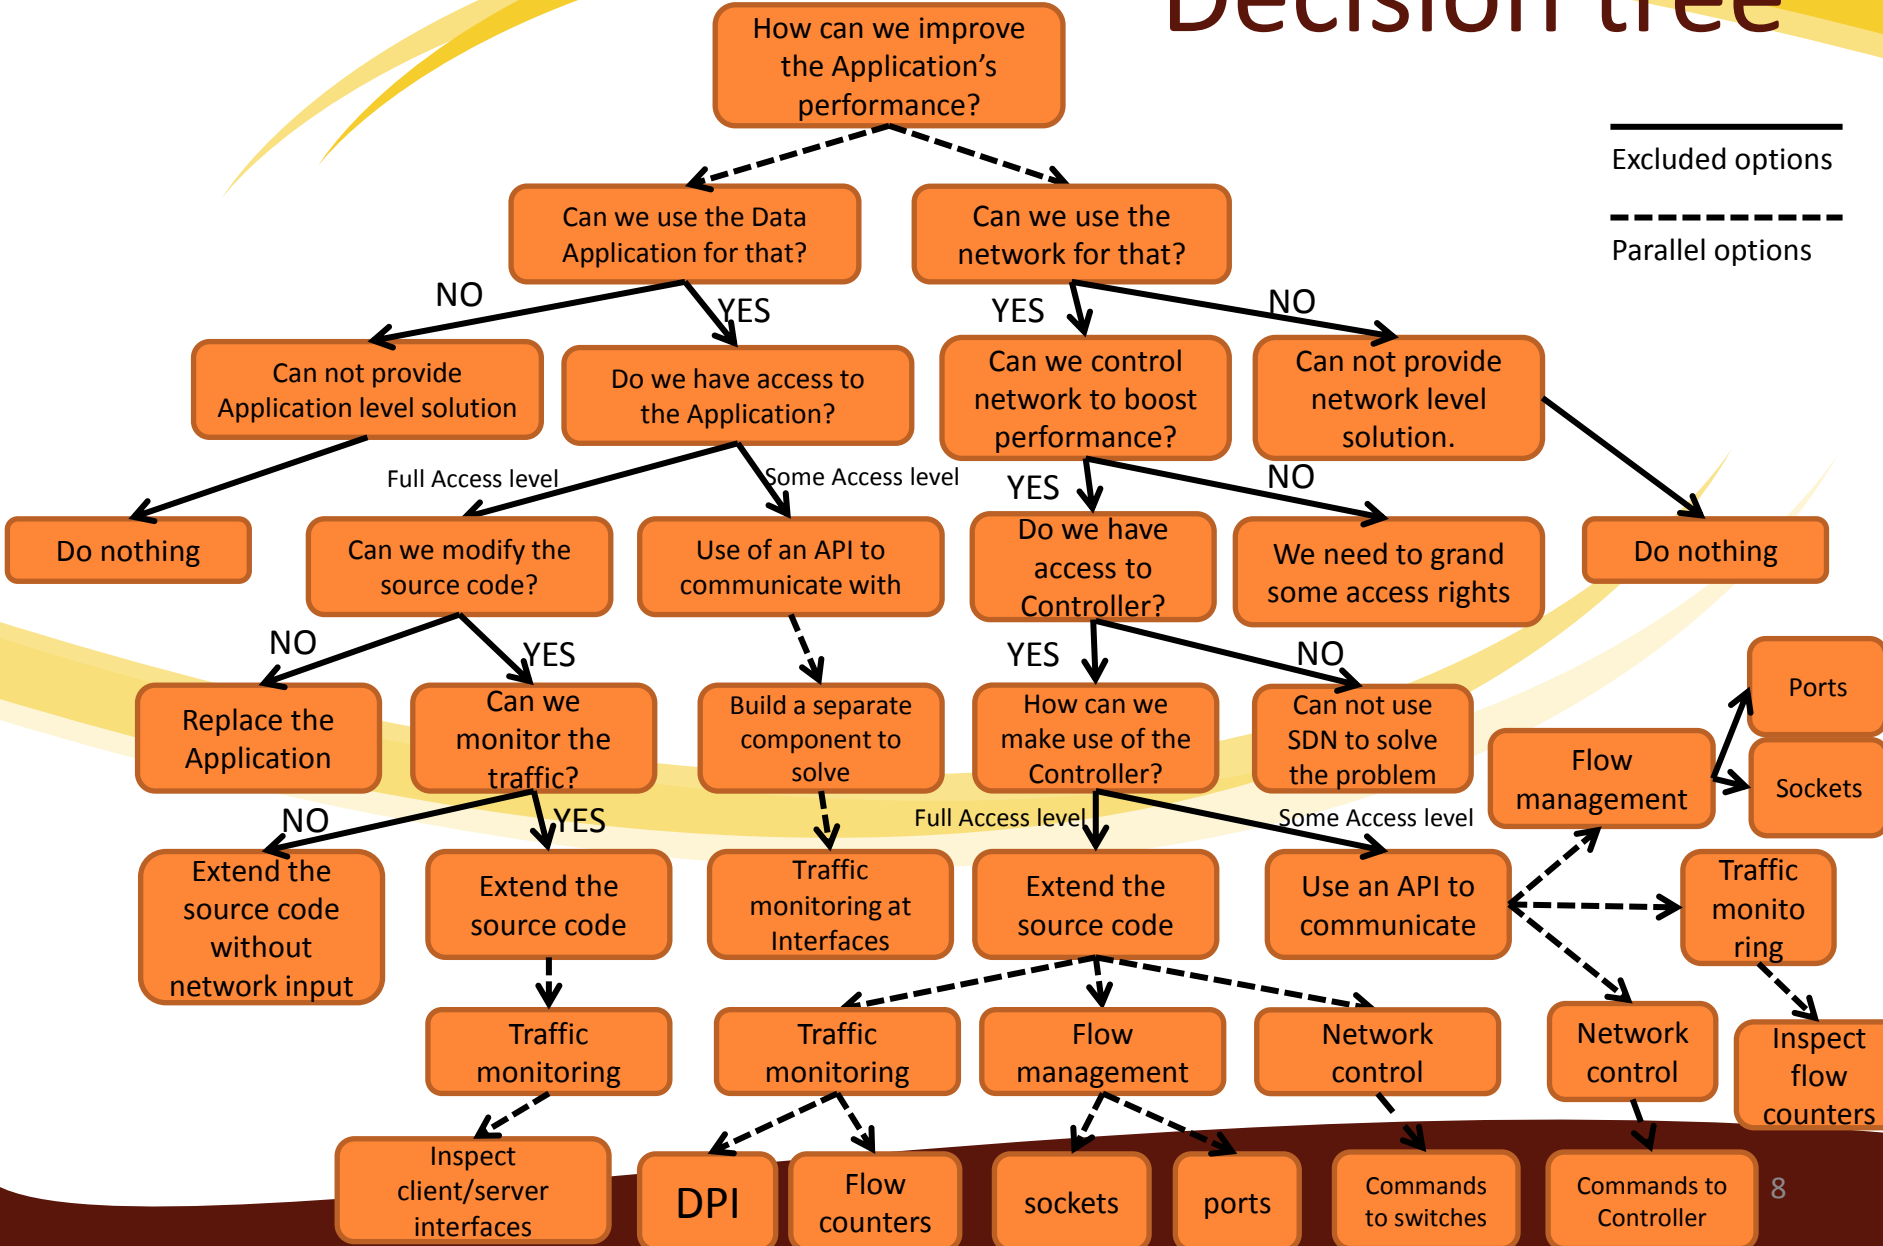

Performance problem?

Available technologies

- **Traffic monitoring**
 - *Deep Packet Inspection (DPI)*
 - *Inspect client/server interfaces*
 - *Inspect flow counters*
- **Flow management**
 - *Port level*
 - *Socket level (IP address and TCP port)*
- **Network Controllability**
 - *Commands to the controller (API)*
 - *Commands to the switches*

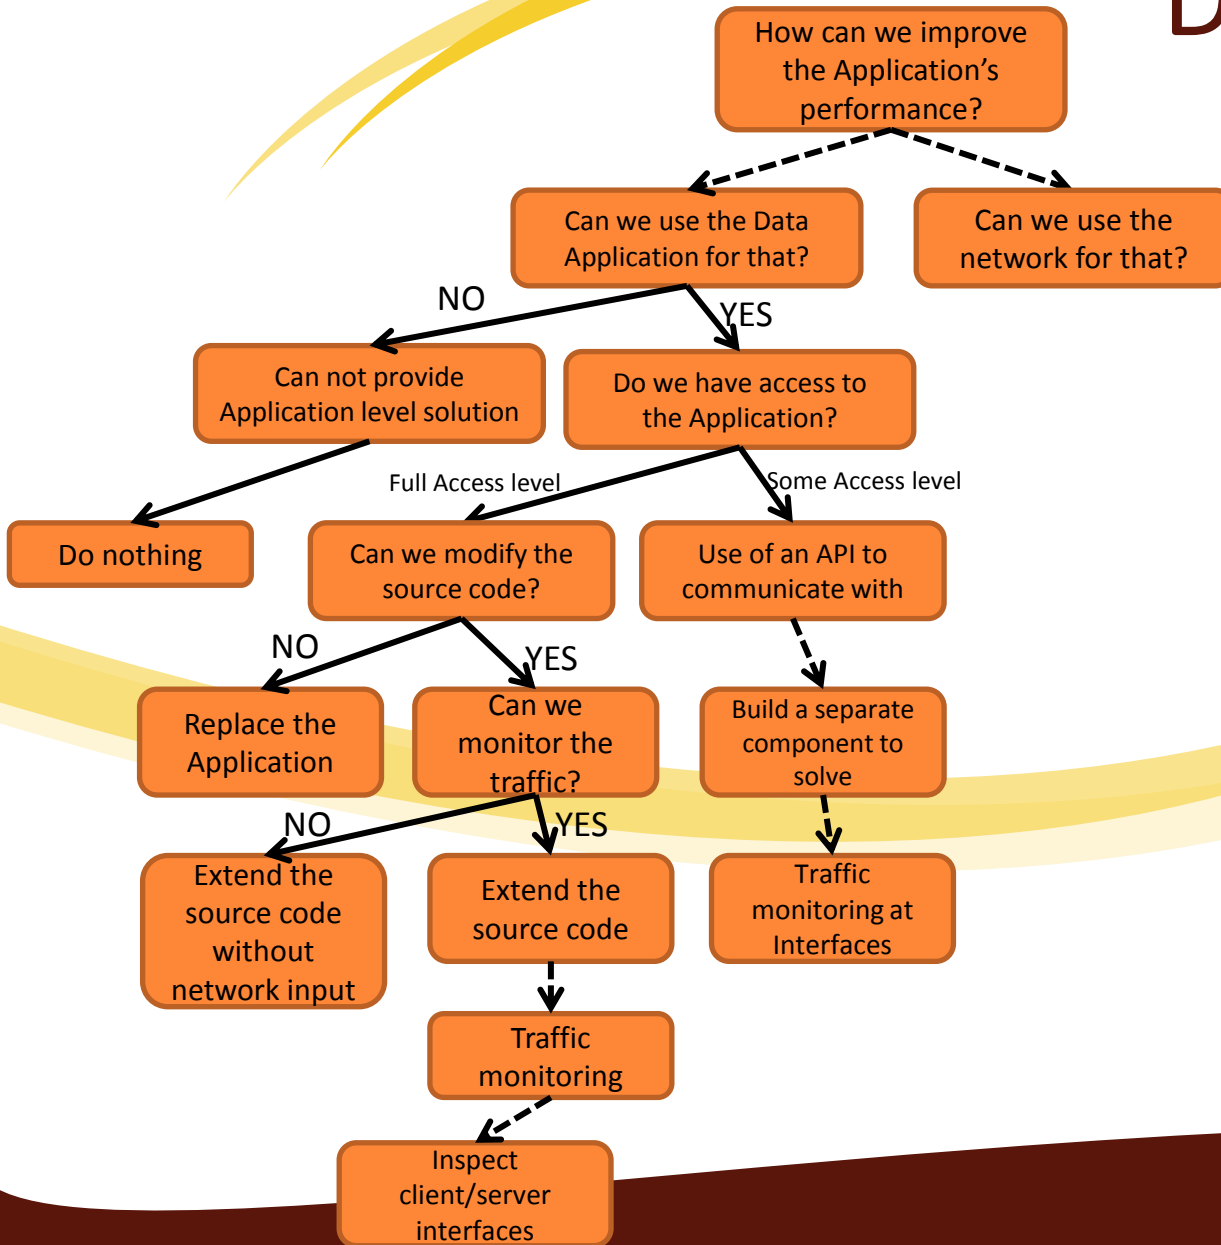

Decision tree

Decision tree

Excluded options

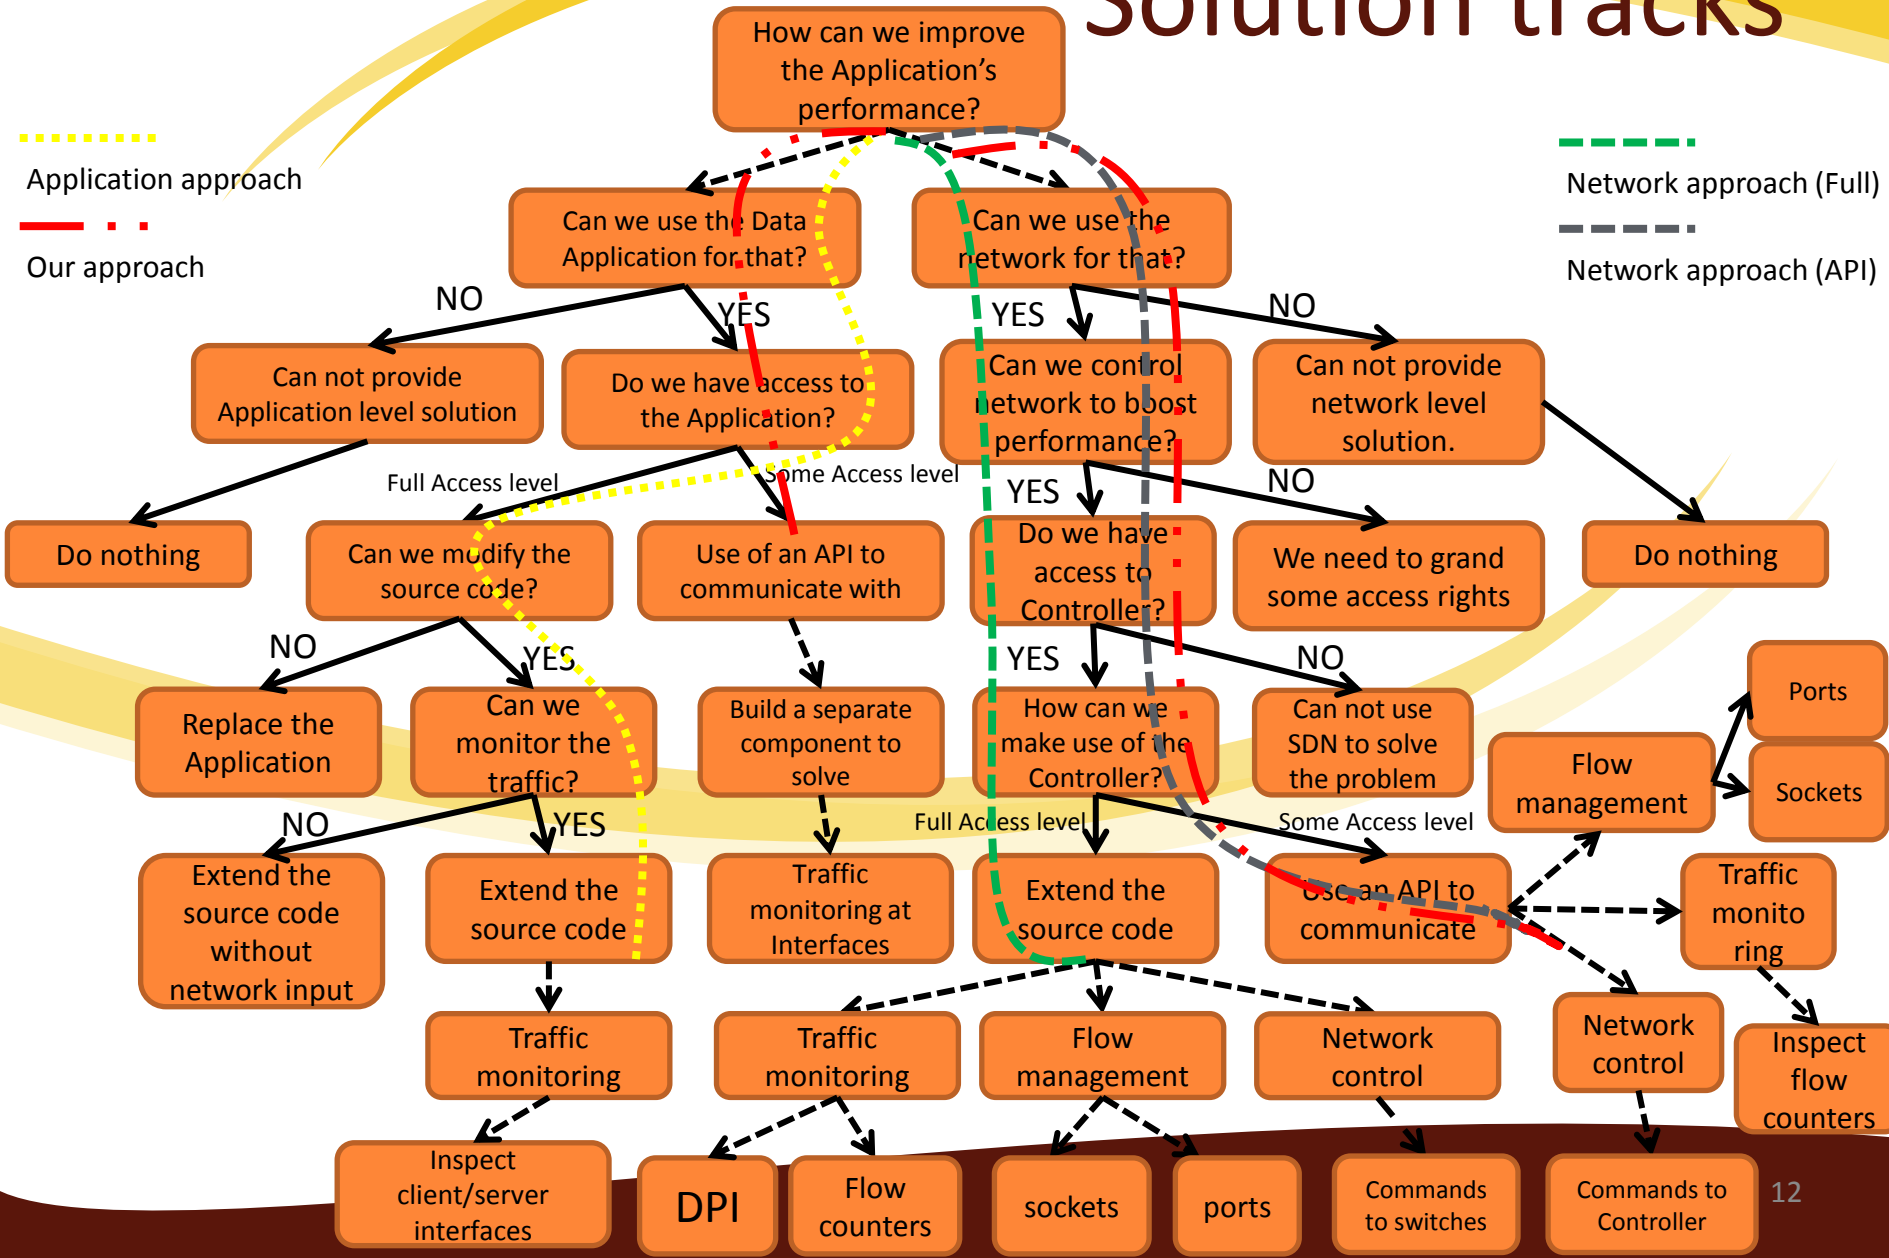

Parallel options

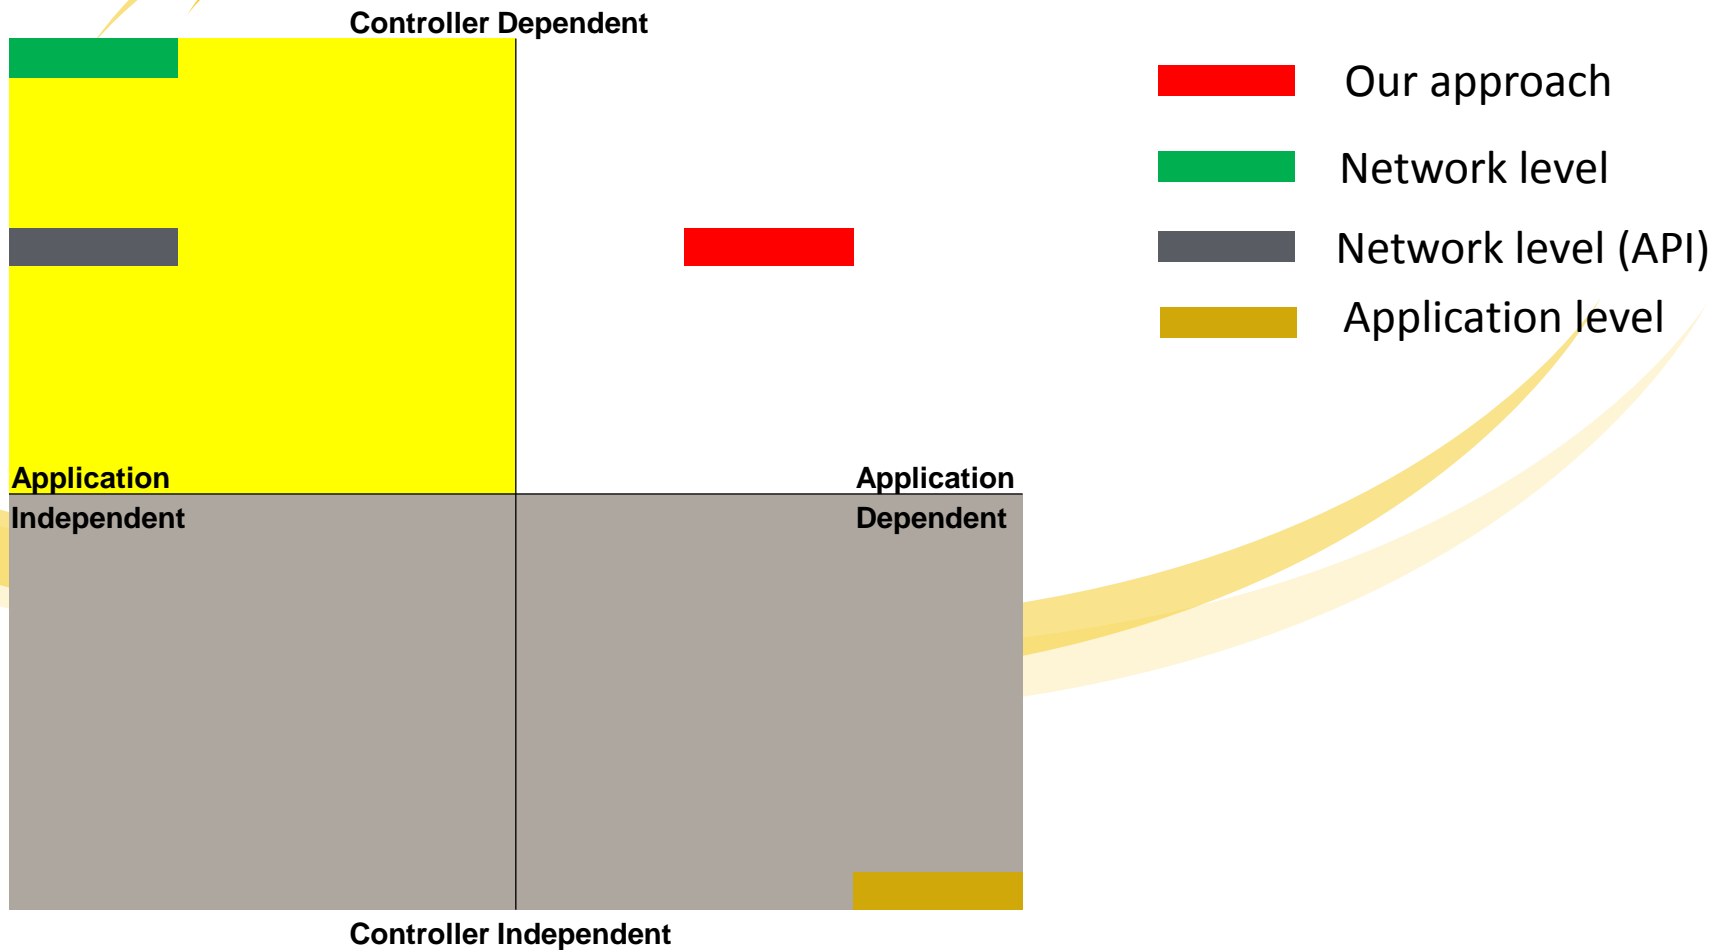

Solution development profiles

Requirements	Application level Programmer	Network Programmer (API)	Network Programmer (full)	Hybrid Programming
Develop at Application level	YES	NO	NO	YES
Develop at Network level	NO	YES	YES	NO
Make use of SDN Technology	NO	YES	YES	YES
Access to the Application	YES	NO	NO	SOME
Access to the Controller	NO	SOME	YES	SOME
Network topology knowledge	NO	YES	YES	YES
Network status knowledge	SOME	YES	YES	YES
Traffic monitor using DPI	NO	NO	YES	NO
Traffic monitor on flow level	NO	YES	YES	YES
Traffic monitor at Interfaces	YES	NO	NO	NO
Flow management	NO	YES	YES	YES
Network controllability	NO	SOME	YES	YES

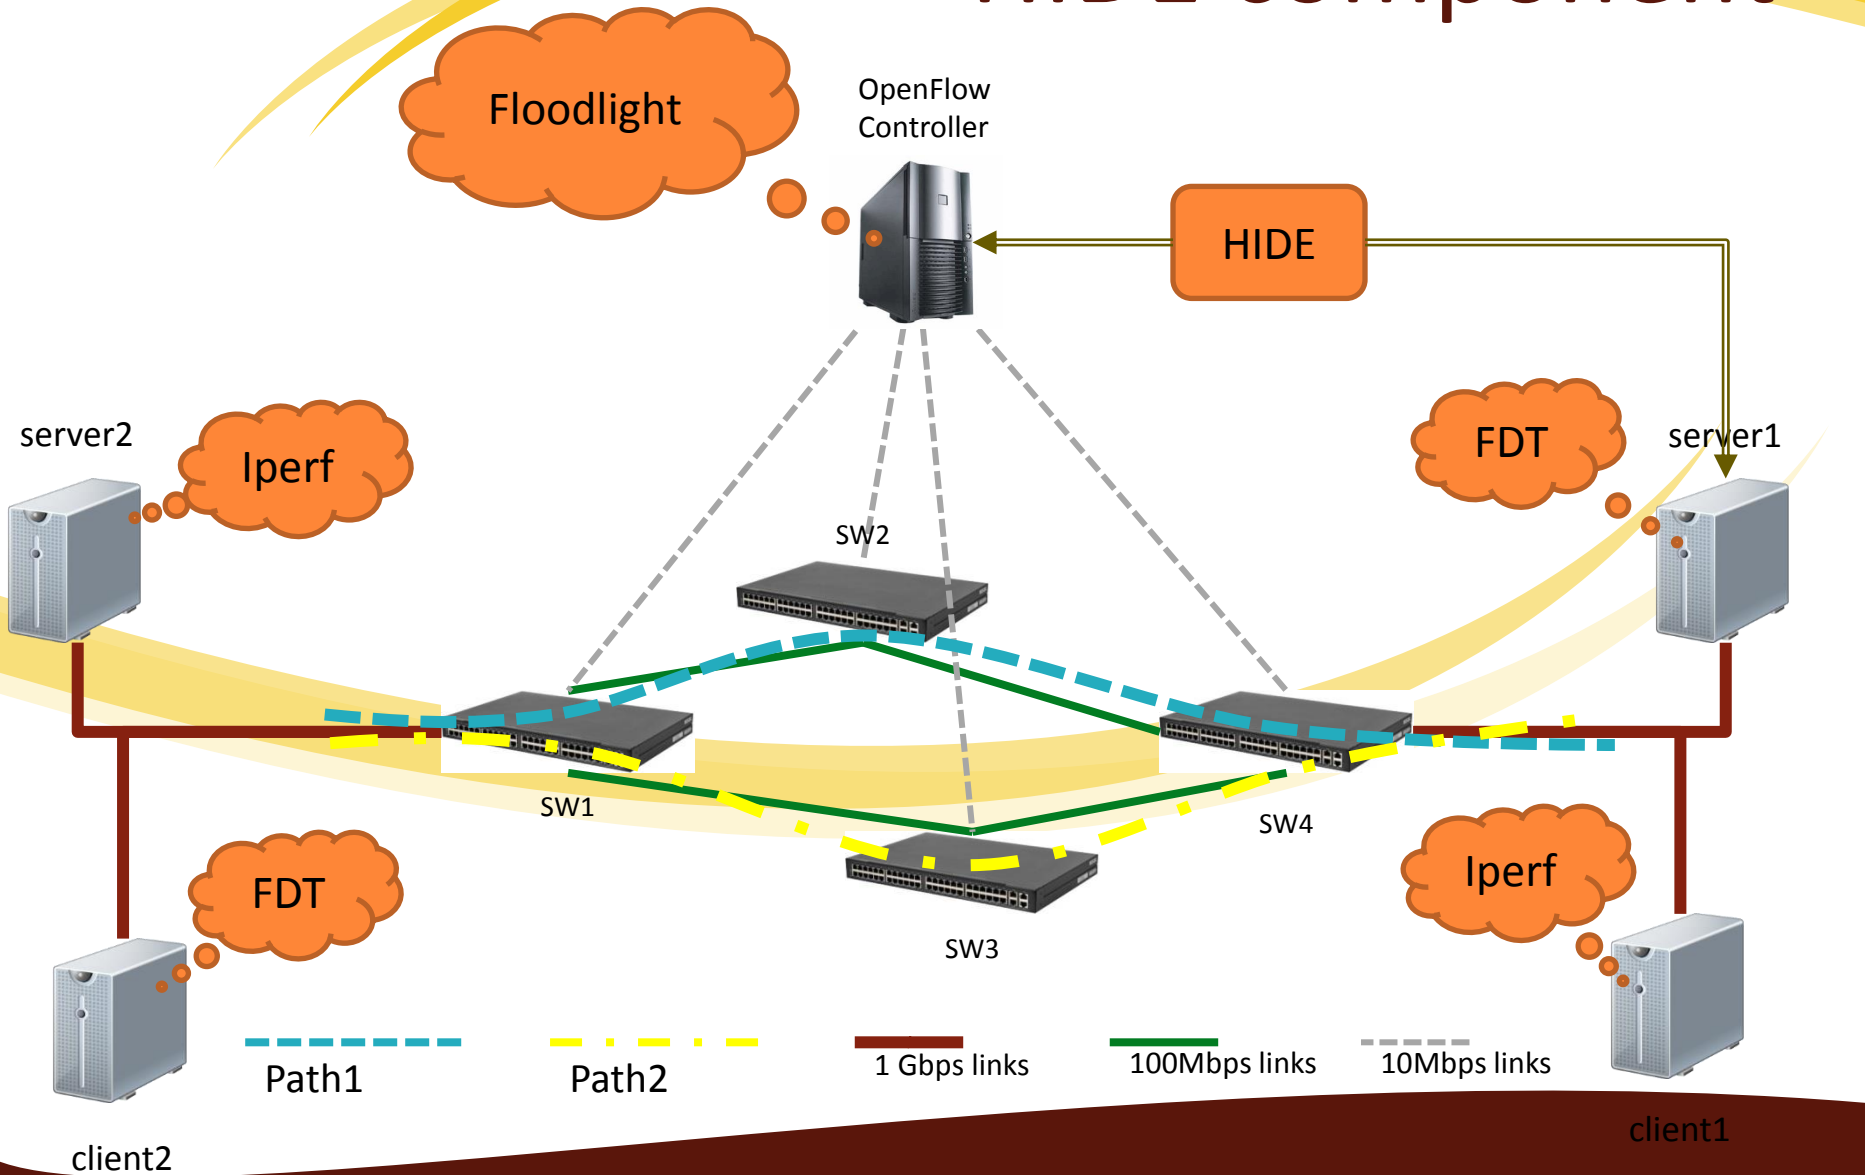

Solution tracks

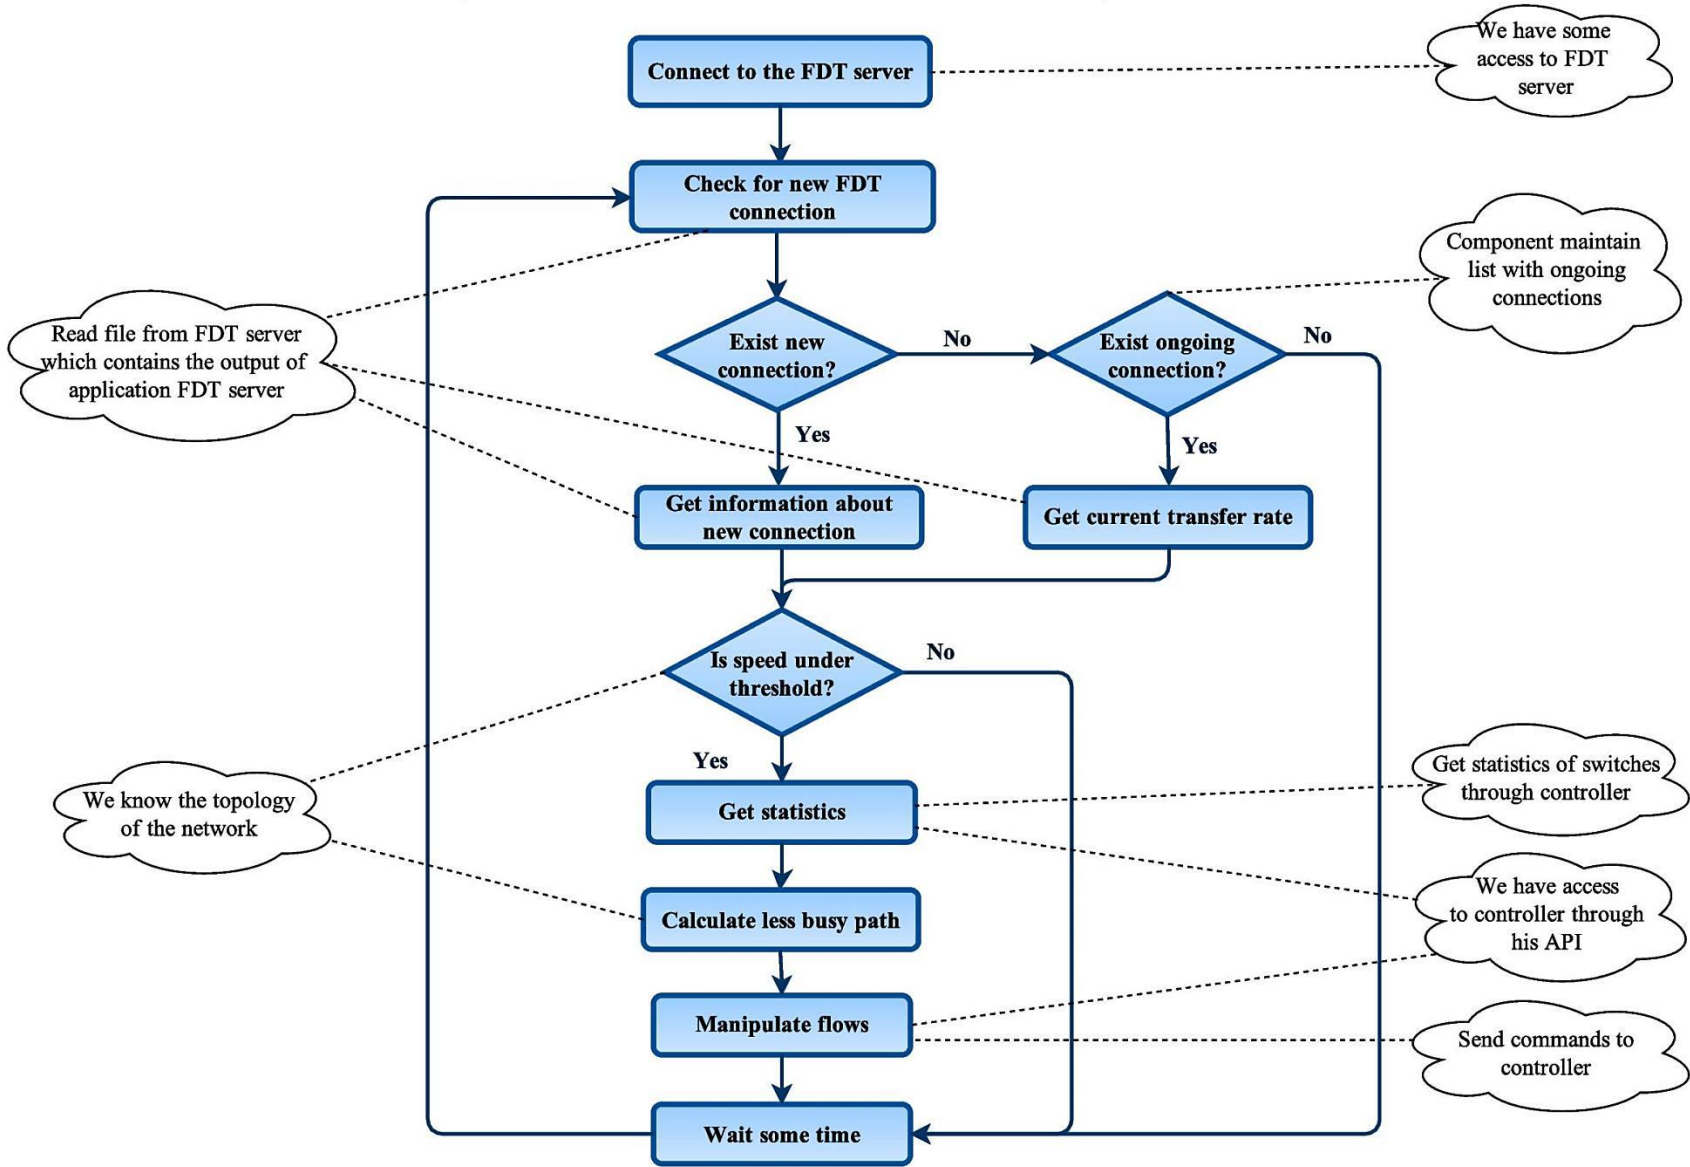

Controller-Application relationship

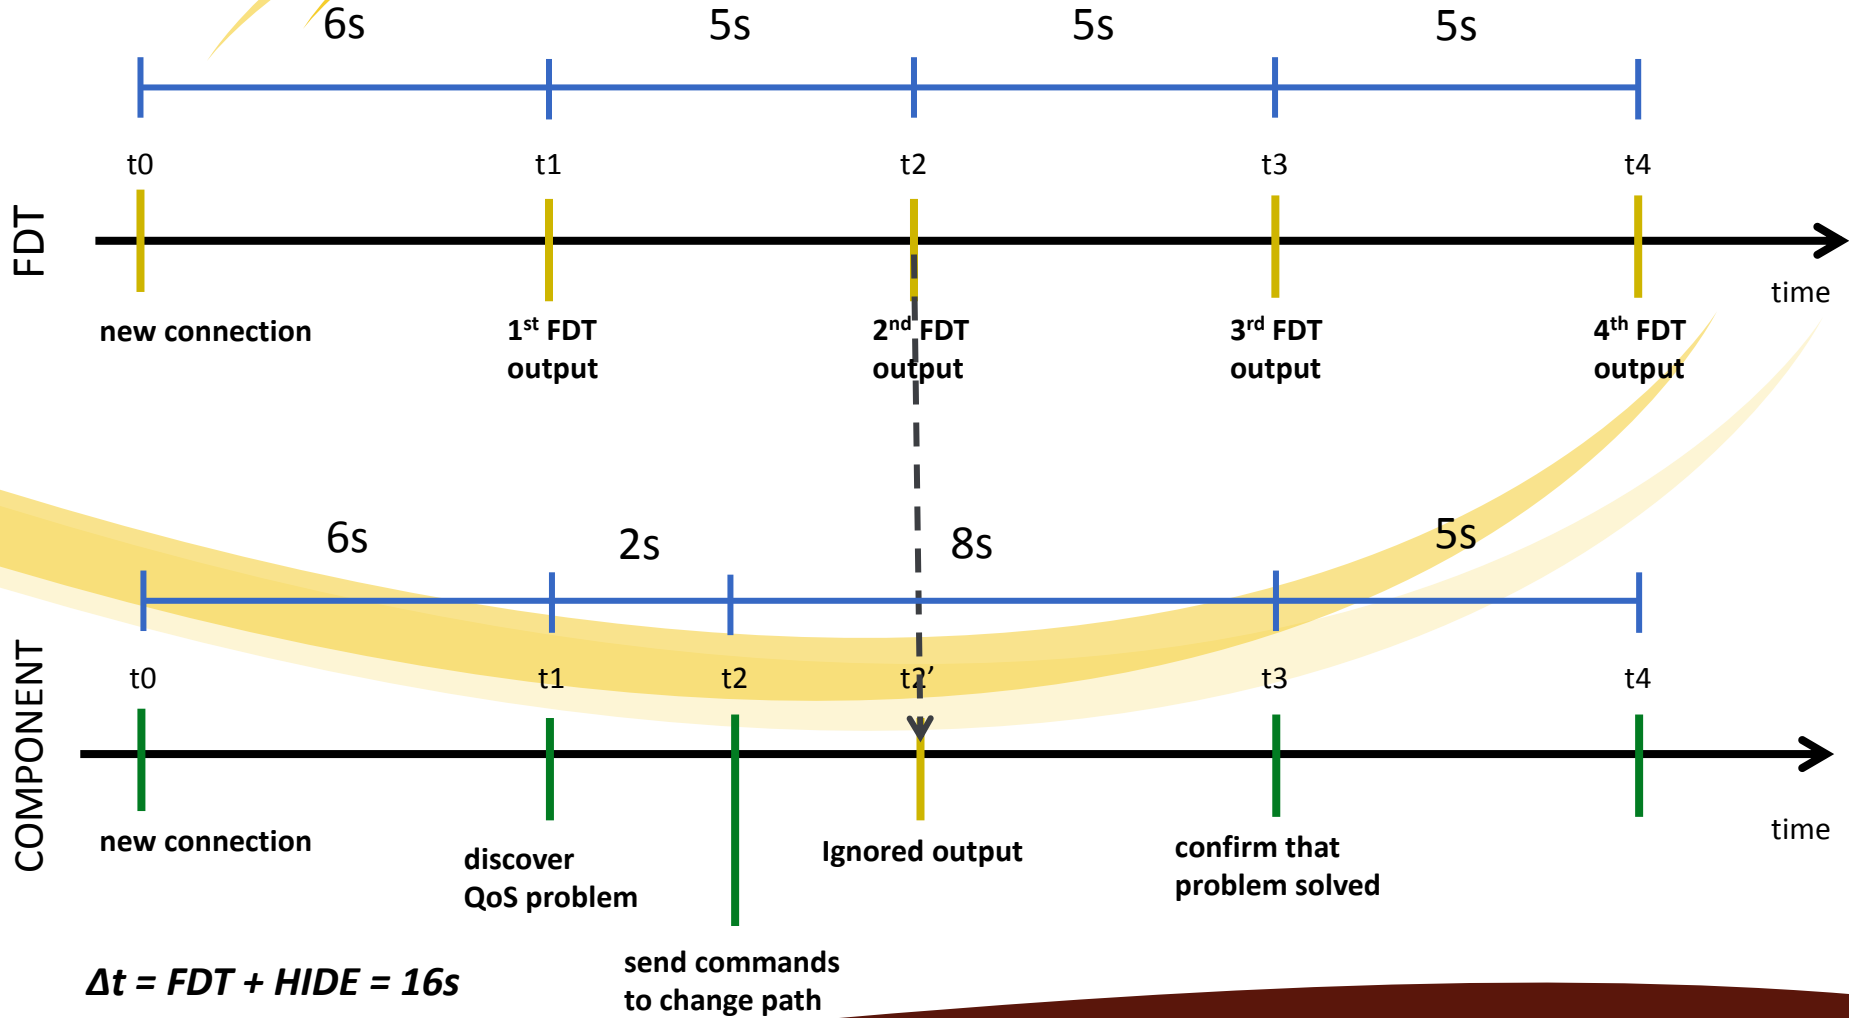

HIDE component

Component's Algorithm

HIDE overhead

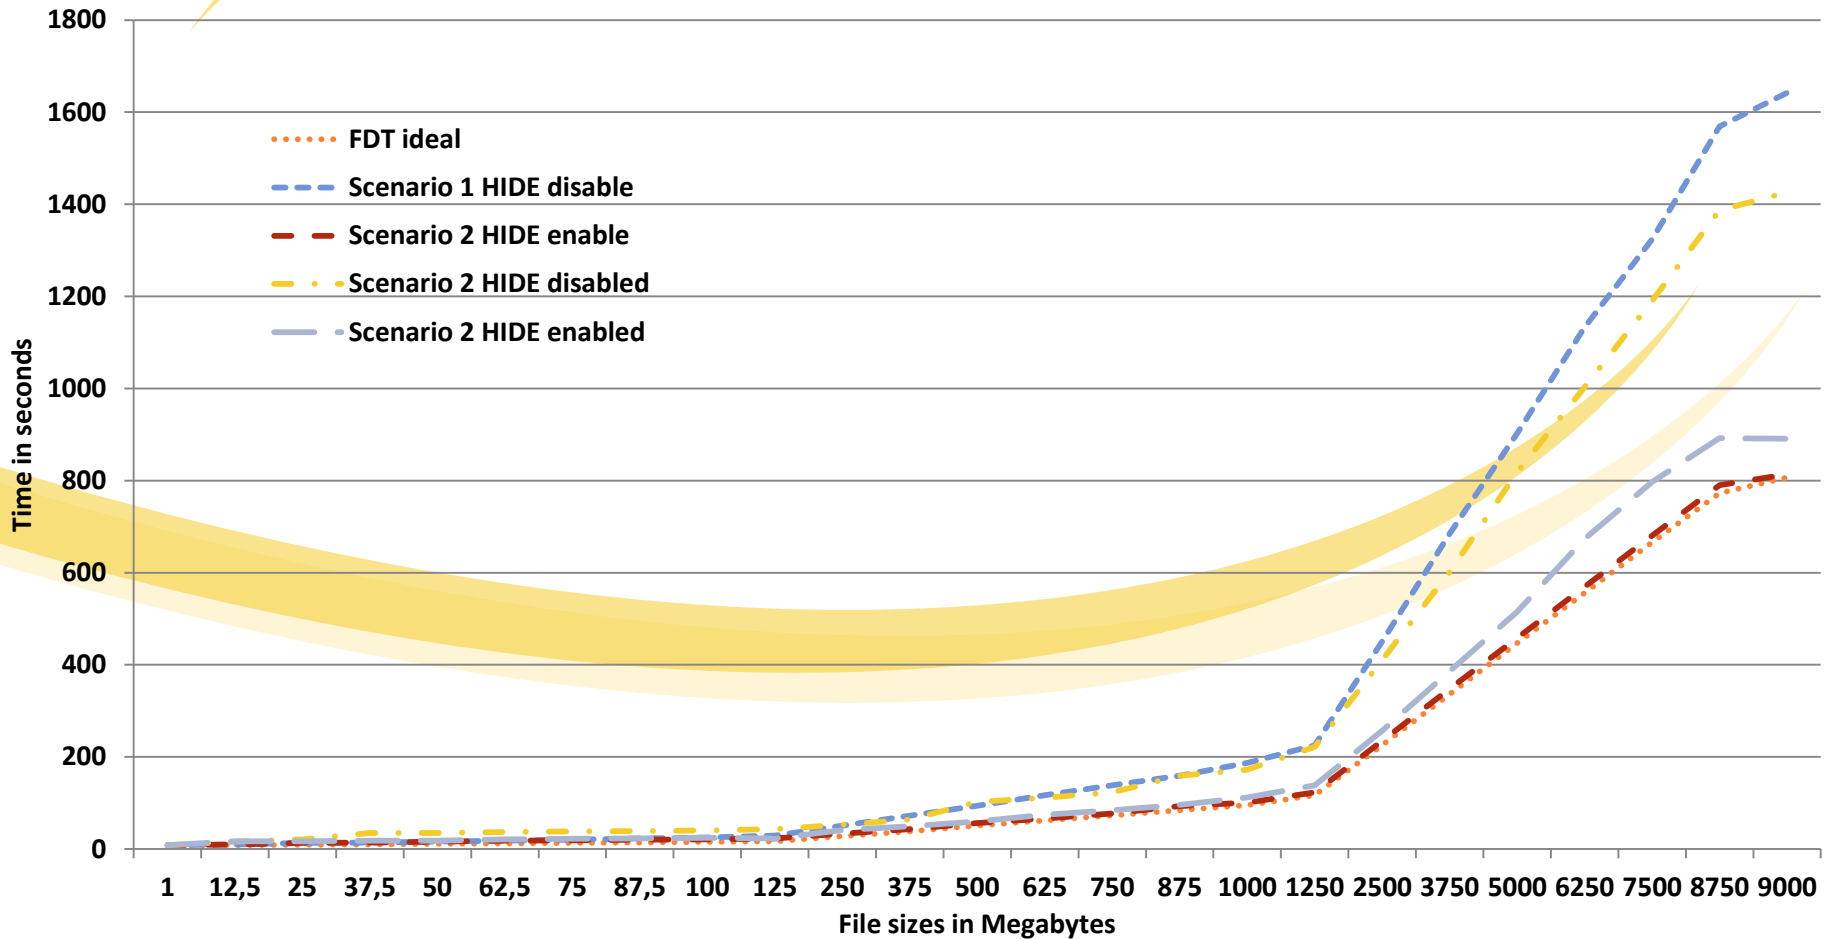

Scenarios

- **Scenario 1**
 - Transferring files via Path1 with and without interfering traffic for getting reference points
- **Scenario 2**
 - Transferring files via Path1 with interfering traffic and component enabled
- **Scenario 3**
 - Interfering traffic change path every 30s in order to stress HIDE for longer period

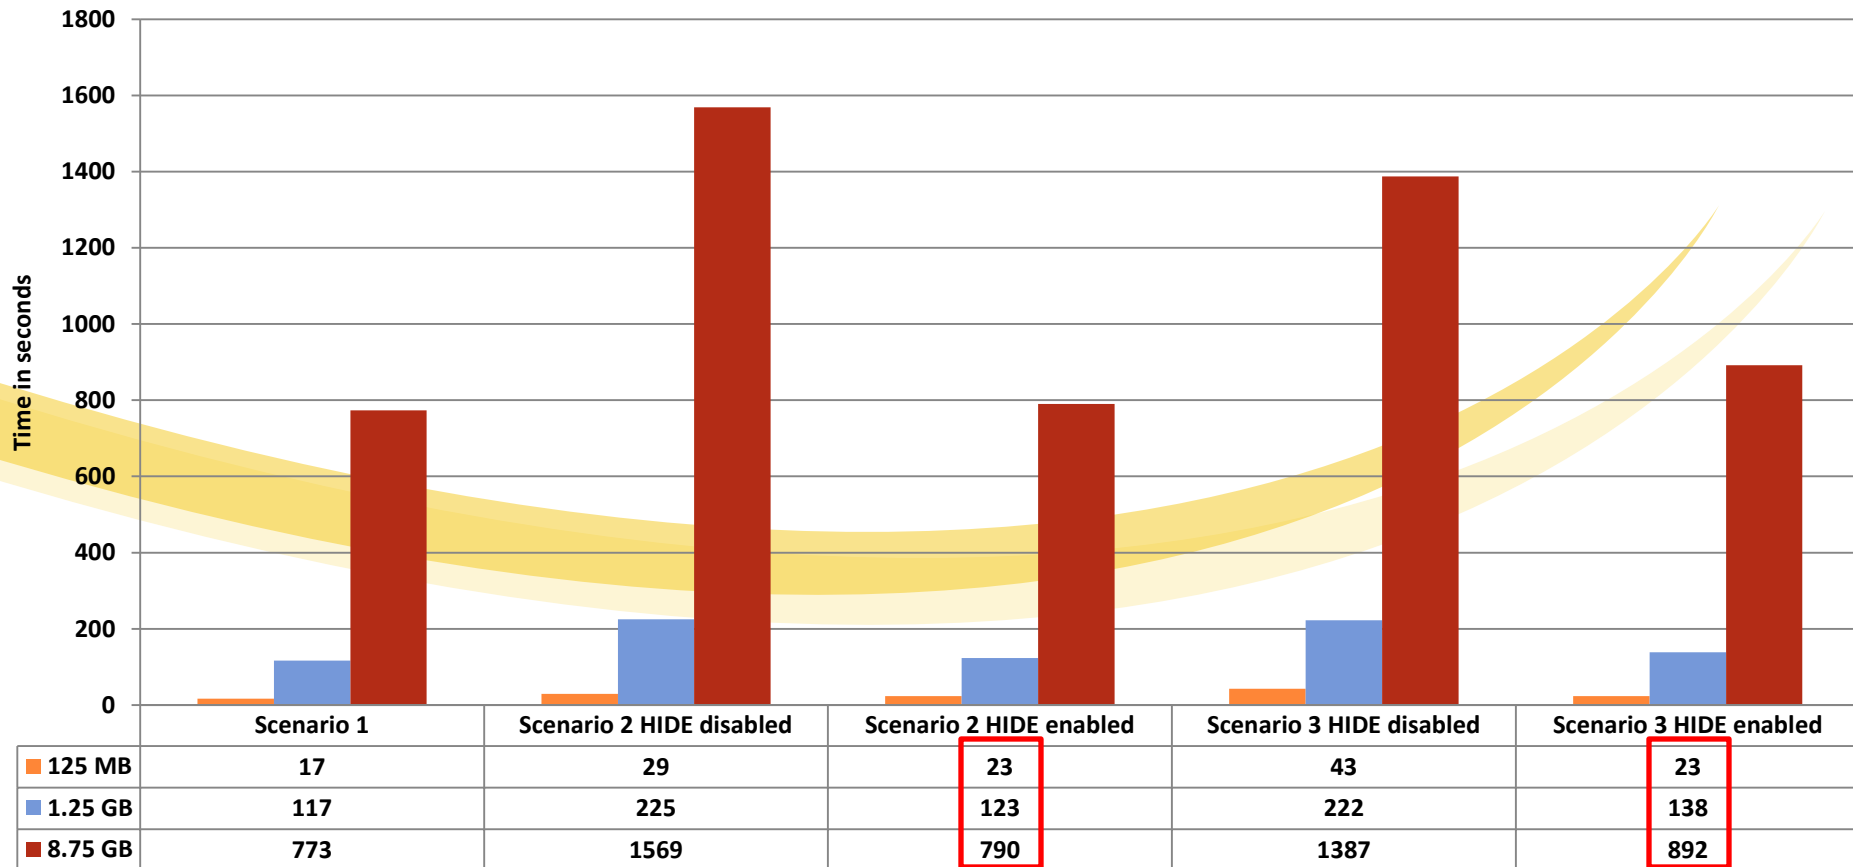

Scenario results

FDT performance on transferring different files

Total transfer time

Total time for transferring three different files

Representative sample of Scenario 3

File size 1.25Gb

Data points every 5s

Discussion

- ✓ Adequate level of abstraction and portability
- ✓ Using SDN to enhance data movement
- ✓ Intelligence based on real time input
- Lower bound of reaction time depended on FDT server
- Topology knowledge should be requested from controller

Conclusion

- Data Movement Applications can gain benefits from SDN
- Through the mentioned degrees of solving the QoS problem we touched one and it was successful
- ExoGENI is well designed environment to deploy topologies and perform experiments

Future work

- Reduce reaction time
(highly depended on FDT)
- Improve intelligence
(get topology knowledge from controller)
- Investigate a prediction algorithm
(avoid network overload)

The slide features two thick, yellow, curved lines that sweep across the top and bottom of the page, framing the central text. The top line starts on the left and curves towards the right. The bottom line starts on the left and curves towards the right, mirroring the top line's shape.

Thank you
