

Why Programmable Networks?

Rudolf Strijkers, Ph.D
December 2017

My background

The Network is in the Cloud

Head of Wireline Operations

Responsible for Broadband conn. of:

- Fixed (67% market share CH)
- Mobile (60% market share CH)
- Telephony, TV

220.000 KM fiber

45000 network elements

20000 new elements per year

UNIVERSITY OF AMSTERDAM

Ph.D. Computer Science

Research Scientist

Senior Enterprise Architect

Intercloud / datacenter / Business connectivity

An aerial photograph of a Swiss city, likely Lucerne, showing a river flowing through the center. A large, prominent church with two tall spires is visible on the left. The city is built on a hillside, and the background shows a lake and distant mountains under a clear sky.

Building the best infrastructure.

24 hours a day, seven days a week. Our network ensures that Switzerland and the people in our country are always connected.

Operators need programmable networks to survive the transition into the digital ecosystem

Reduce OPEX

Faster Service Delivery

Higher reliability

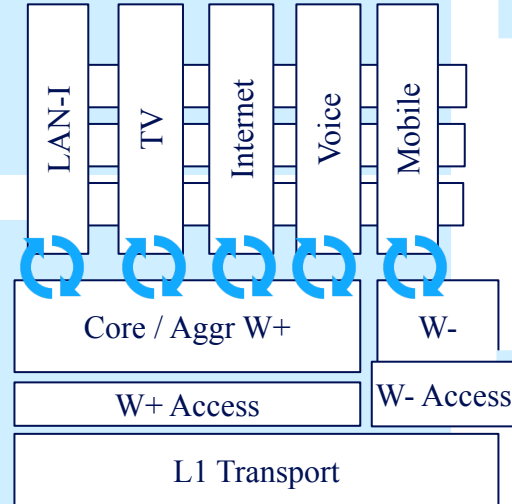

Better manage innovation life-cycles

Adapt to new and different collaboration models

What comes after All-IP? Setting the scene for programmable networks...

All-IP, one network for telco services

- > Services coupled to the network
- > Feature development impacts whole stack -> expensive, slow
- > Layered architecture
- > Monthly releases

- > One IP network
- > Provisioned with services
- > Life-cycle > 5 years

Decouple services from network

- > Decoupling service / network
- > Modular architecture
- > Fast time-to-market
- > Short product life-cycles

- > Rock-solid IP network
- > Low-cost scalability
- > No services
- > Life-cycle > 5 years

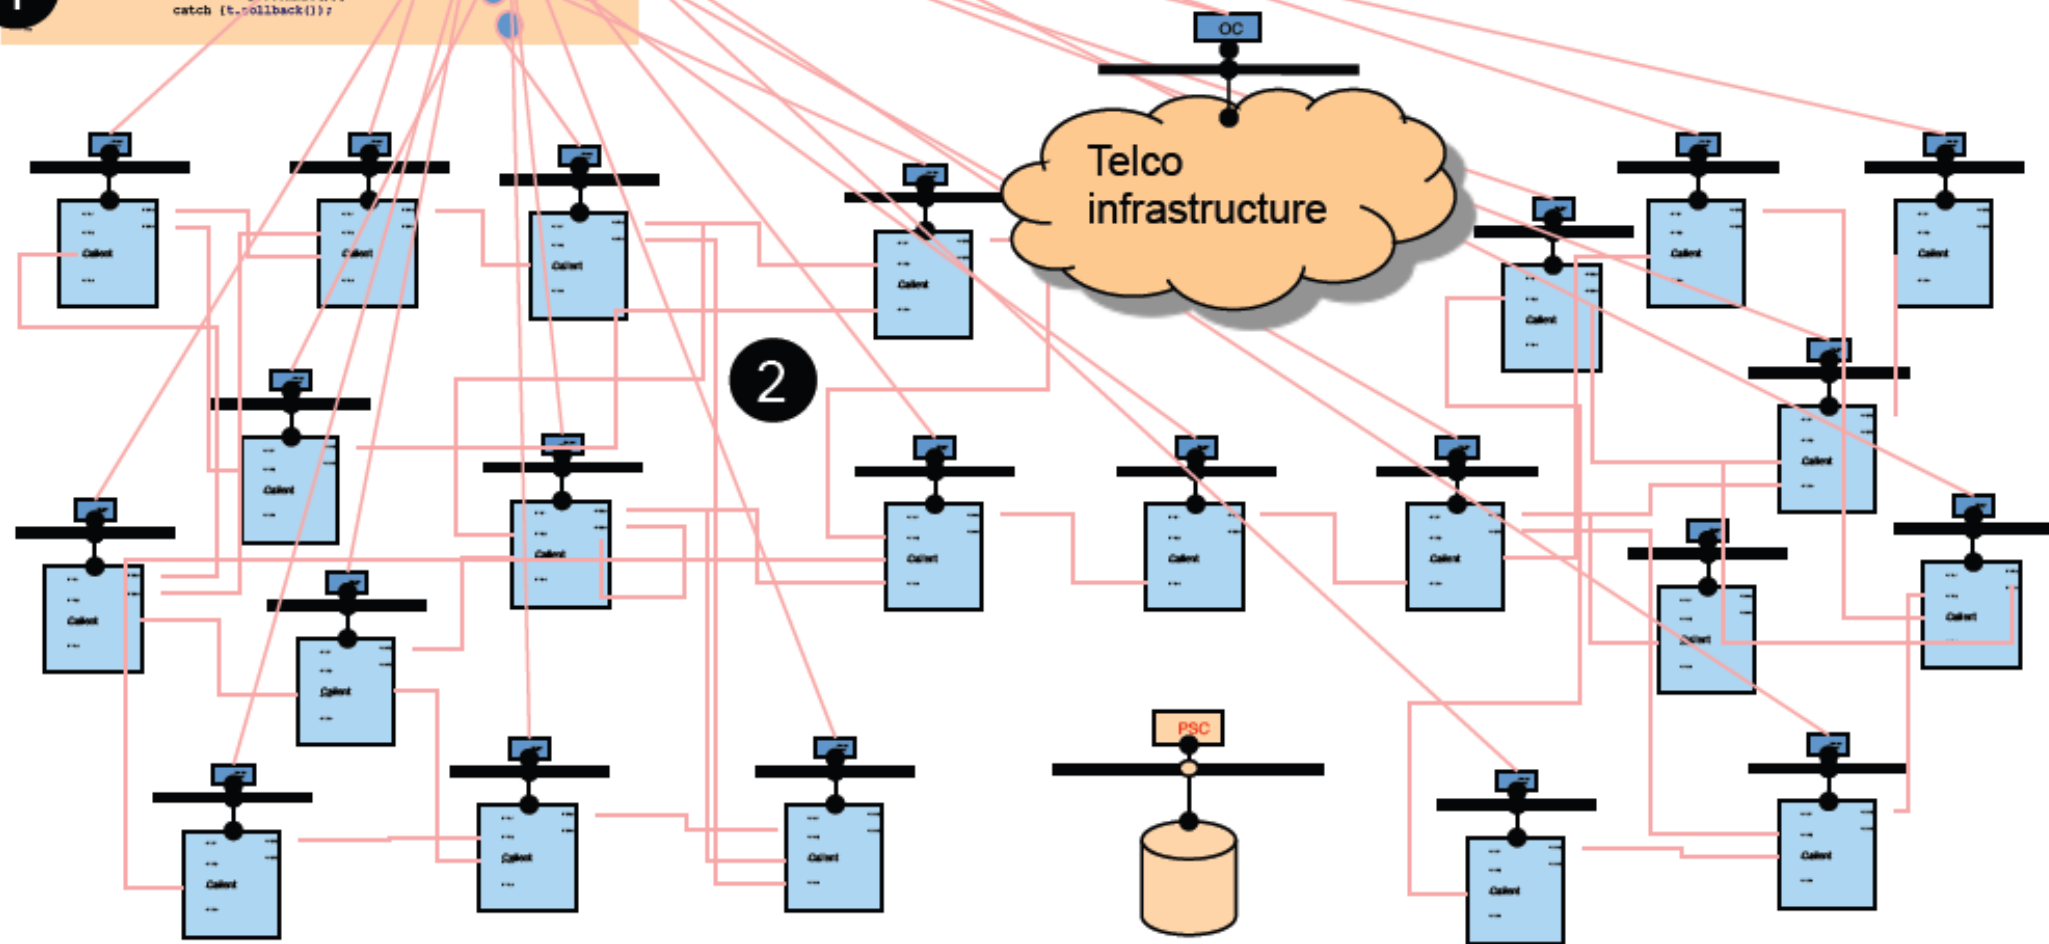

Network nodes become objects in program code

```
1  
R1.forward(139.63.65.0.0.0.0);  
-  
path p = new path();  
networkElement ne = new networkElement;  
pathCollection Paths =  
    new pathCollection(UniversalLambdaAddress1,  
        UniversalLambdaAddress2);  
{  
    for each p in paths  
    {  
        BEGIN MANUAL TRANSACTION T  
        try {  
            for each ne in p {  
                T.register(ne);  
                ne.reserve("25-mgt-2084 1030h", "1000r");  
                #??.commit(!r);  
            }  
            catch [t.rollback()];  
        }  
    }  
}
```

1

3

2

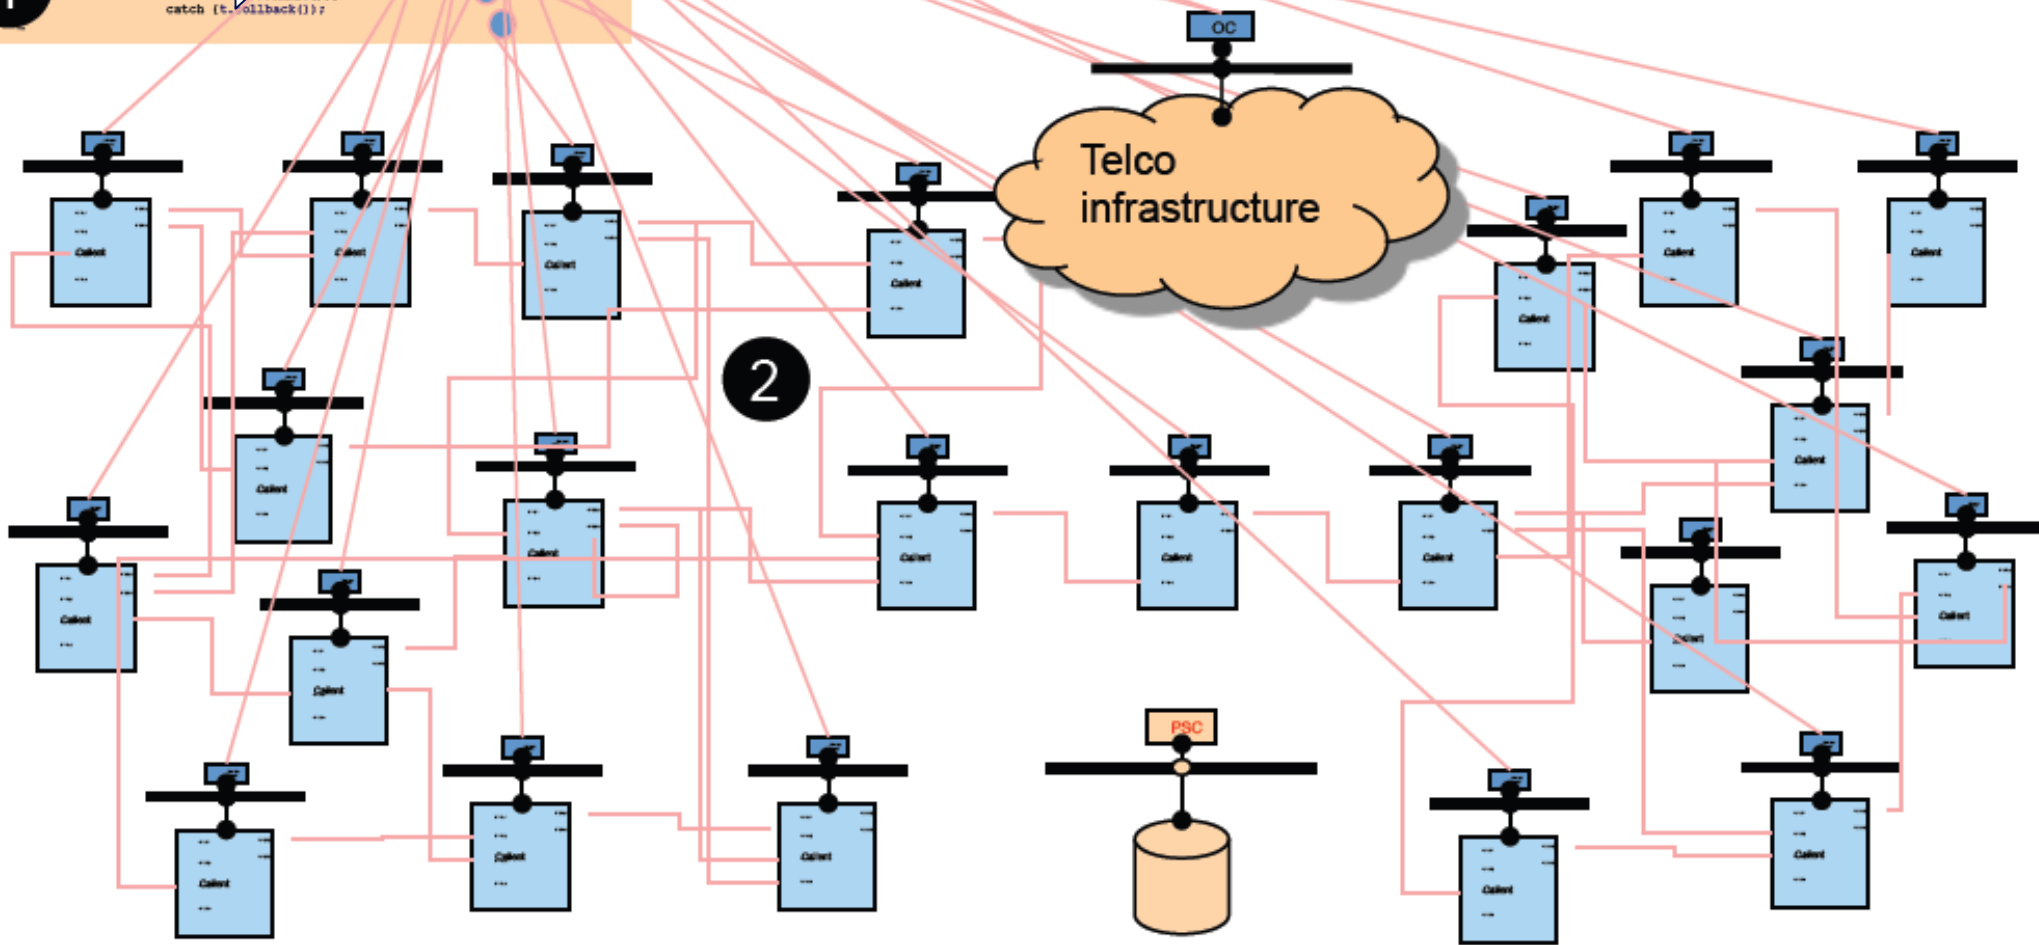

Control Loop

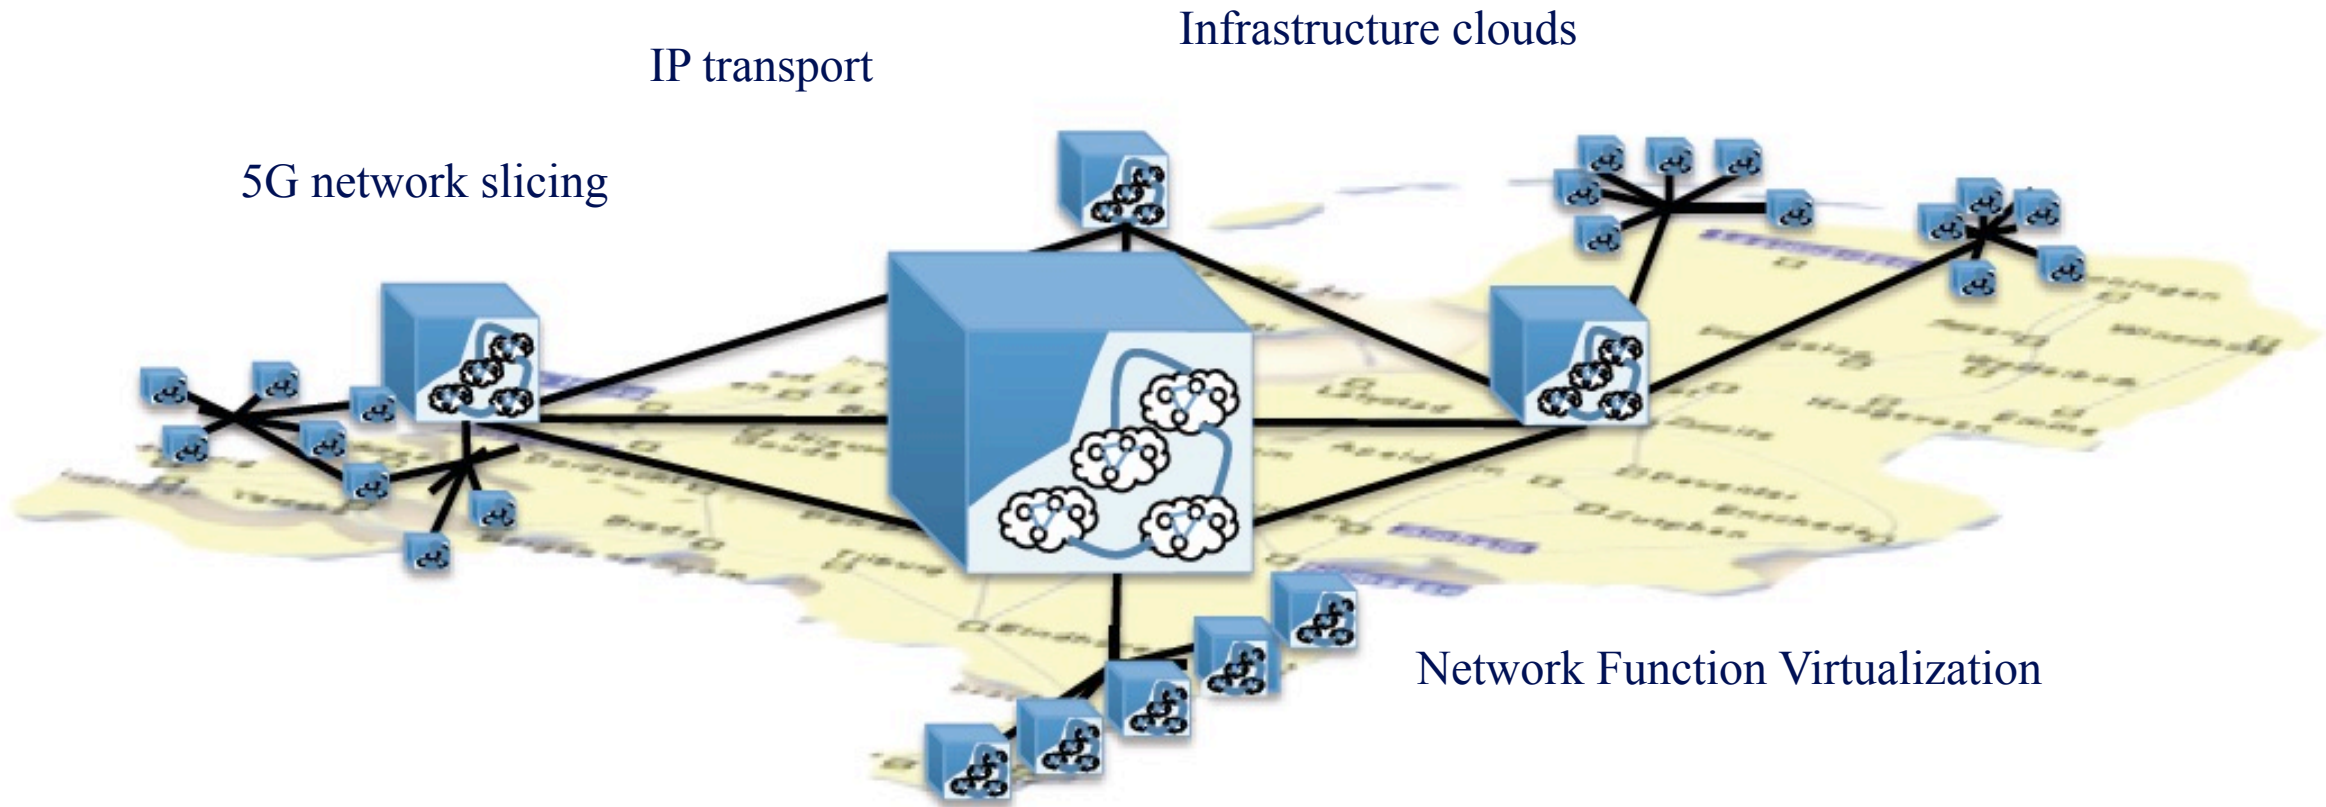

```
1 R1.forward(139.63.65.0.0.8.0.0);  
- path p = new path();  
networkElement  
pathCollection  
new  
Collection(UniversalLambdaAddress  
UniversalLambdaAddress2);  
{  
for each p in paths  
{  
BEGIN MANUAL TRANSACTION  
try {  
T.register(  
no.reserve(  
no.reserve(  
no.reserve(  
catch [t.rollback()]};
```

3 Now we can manage networks in Software!

Pro-active, automated, implementation and re-use of know-how: self-*

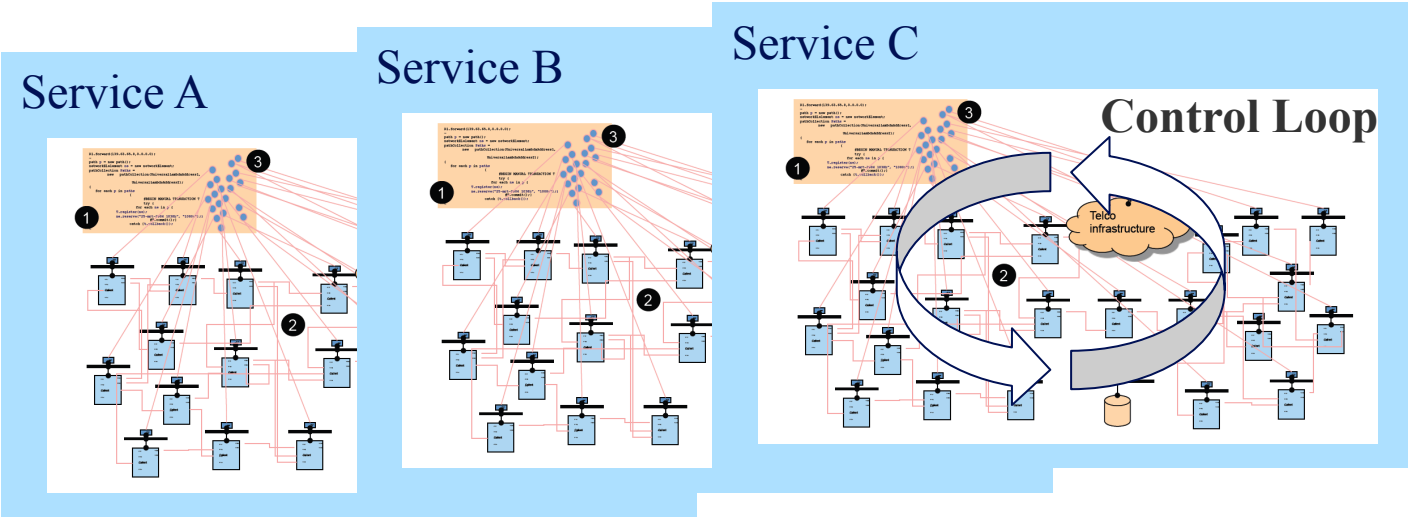

Infrastructure clouds are the basis for future telecom infrastructure. They can be reprogrammed for application-specific exploitation.

Broadband delivers basic connectivity, Cloud the intelligence

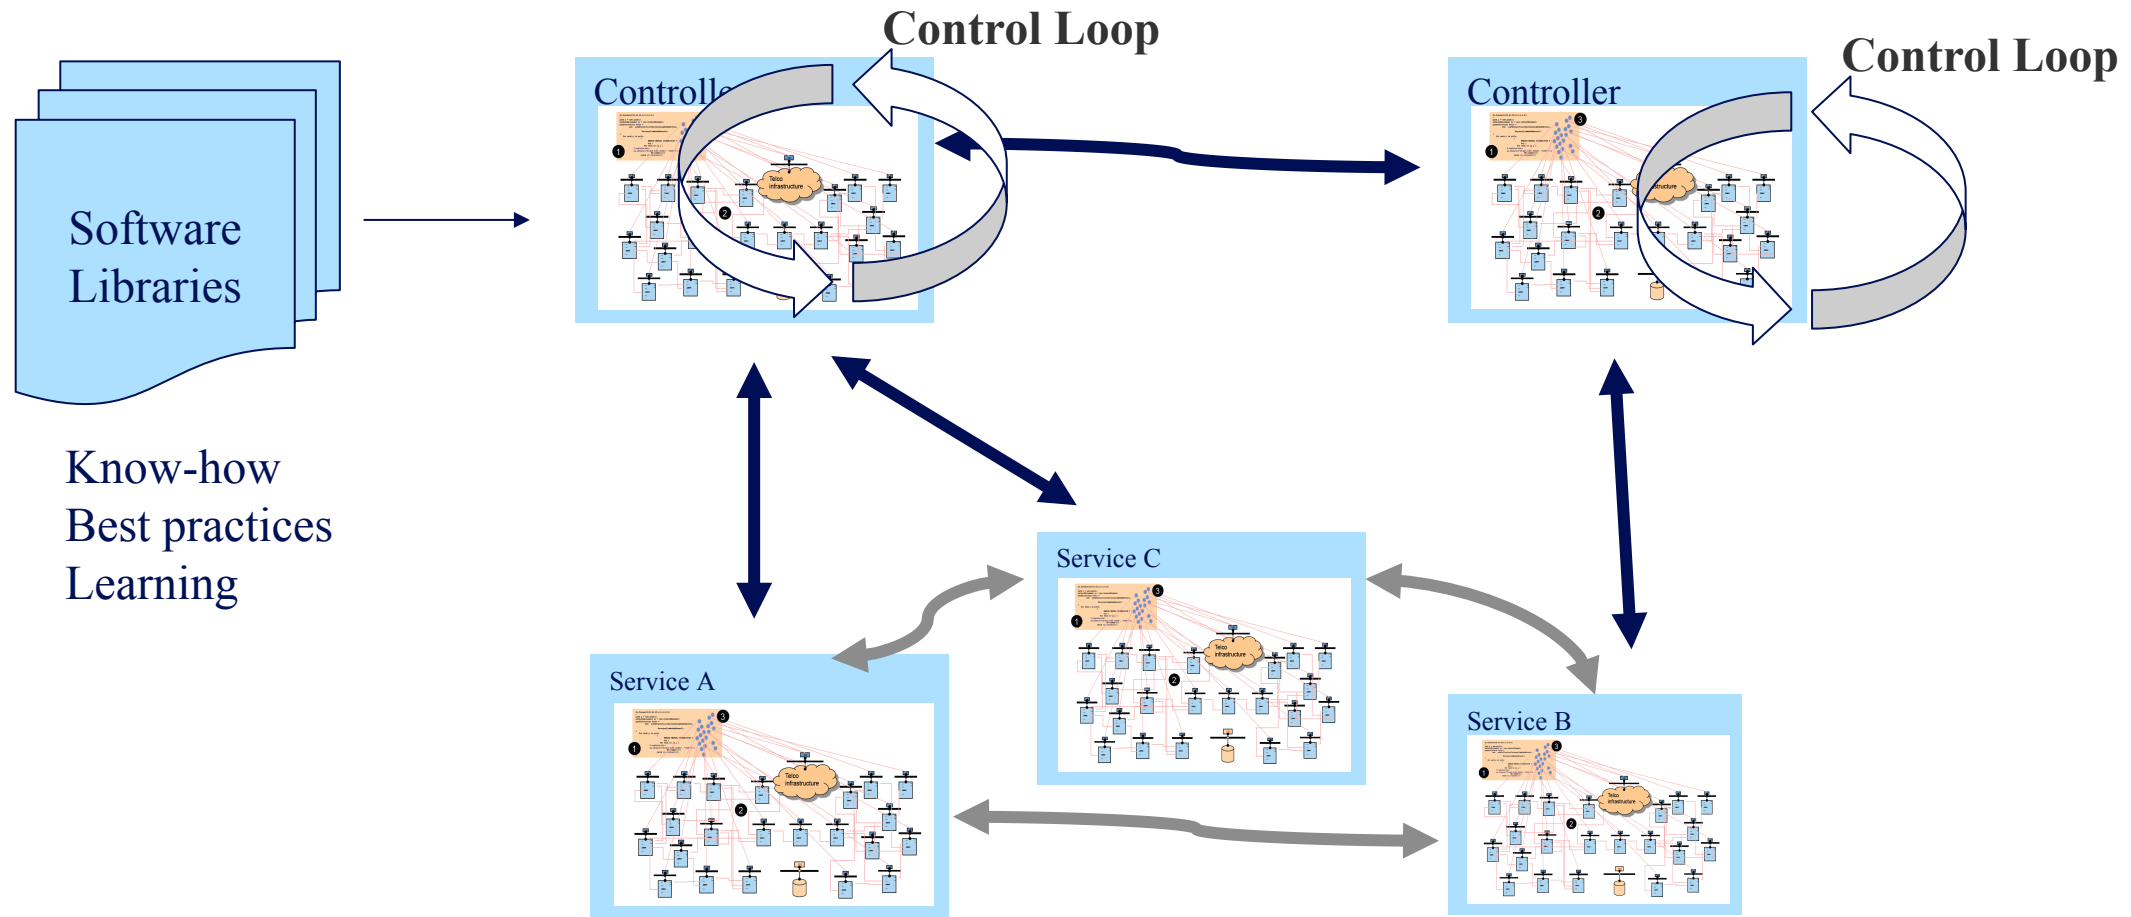

Next generation telecom services are fully engineered and managed in Software

Mass customization, segment and customer specific networks

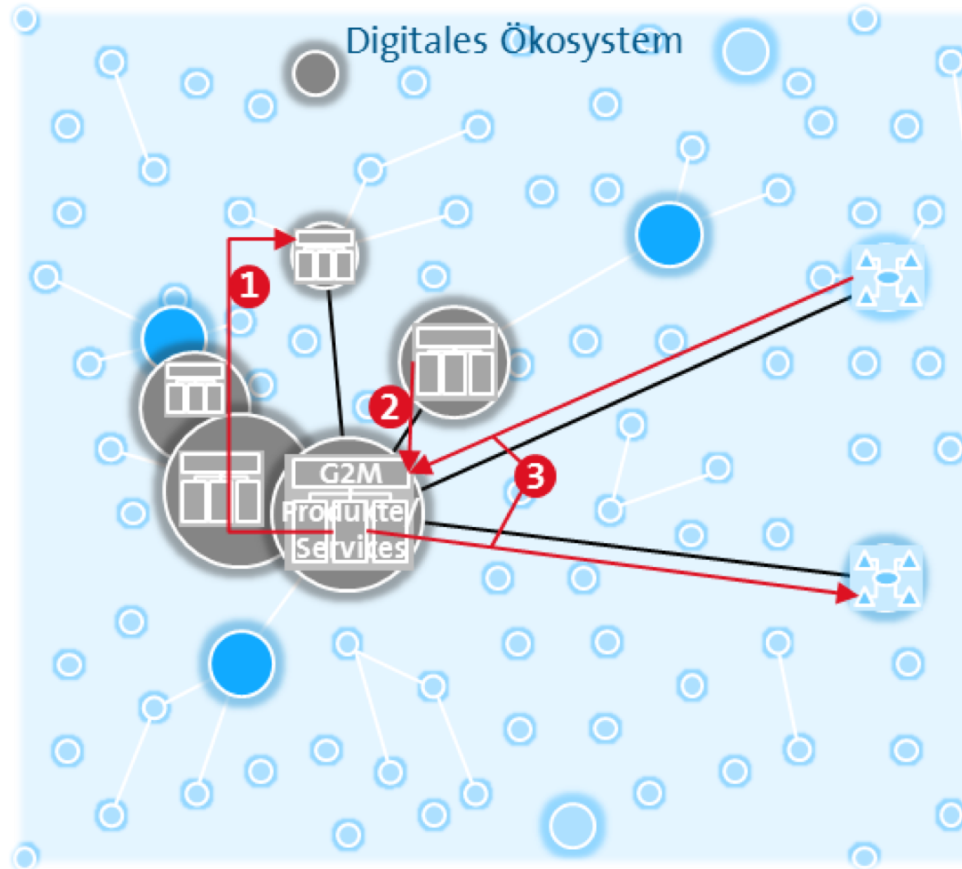

Controllers manage the boundary conditions of services. Companies interconnect their services and networks

Who ensures that these systems and interconnections work correctly and according agreements?

The digital ecosystem

Operators need to address three challenges in the digital ecosystem

 Architekturmodell
Telecom-Branche

 Architekturmodell
andere Branche

Core business will be broken down to different smaller cores with their own portfolios

1) How to deliver a seamless user experience?

Decentralized innovation requires open architectures

2) How to ensure a coherent enterprise architecture?

New collaboration models, b2b2c, integration in businesses

3) How to integrate and adapt to different business architectures?

Thank you. Questions?
